Lab Work 6 (Minimax, Alpha Beta Pruning)

Lab Instructor	Momna Javaid
Department	Computer Science

Of Computer & Emerging Sciences Faisalabad-Chiniot Campus

Instructions:

- 1. You also have to submit .ipynb file.
- 2. Comments in the code explaining chunks of the code are important.
- 3. Plagiarism is strictly prohibited, 0 marks would be given to students who cheat.

Lab Tasks:

Task 1:

Minimax is a method used to evaluate game trees. Implement an algorithm for calculating the optimal move using Minimax—the move that leads to a terminal state with maximum utility, under the assumption that the opponent plays in a 2 player game.

MAX

- Wants to maximize the result of the utility function
- Winning strategy if, on MIN's turn, a win is obtainable for MAX for all moves that MIN can make

MIN

- Wants to minimize the result of the utility function
- Winning strategy if, on MAX's turn, a win is obtainable for MIN for all moves that MAX can make

 $\mathbf{Max} = -\infty$

 $Min = +\infty$

Calculate the following:

- Complete Path
- Time Complexity
- Space Complexity

Of Computer & Emerging Sciences Faisalabad-Chiniot Campus

The pseudocode of MINIMAX is:

```
\begin{array}{l} \textbf{function } \ \mathsf{MINIMAX-DECISION}(state) \ \mathbf{returns} \ an \ action \\ \mathbf{return} \ \mathrm{arg\,max}_{a \ \in \ \mathsf{ACTIONS}(s)} \ \mathsf{MIN-VALUE}(\mathsf{RESULT}(state, a)) \end{array}
```

```
function MAX-VALUE(state) returns a utility value

if TERMINAL-TEST(state) then return UTILITY(state)

v \leftarrow -\infty

for each a in ACTIONS(state) do

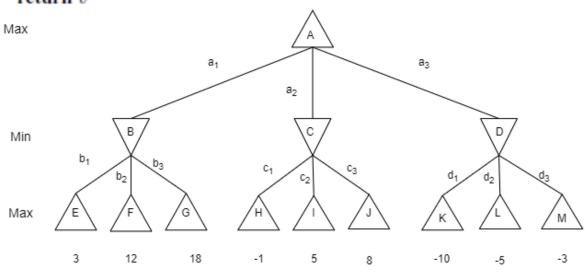

v \leftarrow \text{MAX}(v, \text{MIN-VALUE}(\text{RESULT}(s, a)))

return v
```

function MIN-VALUE(state) returns a utility value if TERMINAL-TEST(state) then return UTILITY(state)

 $v \leftarrow \infty$

for each a in ACTIONS(state) do $v \leftarrow \text{MIN}(v, \text{MAX-VALUE}(\text{RESULT}(s, a)))$ return v

Task 2:

Exhaustively searching a game tree is not usually a good idea. We can use a branch-and-bound technique to reduce the no. of states that must be examined to determine the value of a tree.

Branch-and-bound Technique:

- We keep track of a lower bound on the value of a maximizing node, and don't bother evaluating any trees that cannot improve this bound.
- Keep track of an upper bound on the value of a minimizing node. Don't bother with any sub-trees that cannot improve this bound.

To improve the task 1 you should implement MiniMax with Alpha-Beta pruning (prunes away search tree nodes that are not necessary for finding an optimal solution) in a two player game. Use the same graph as in task 1 for this task.

- At minimizing nodes, we stop evaluating children if we get a child whose value is less than the current lower bound (alpha).
- At maximizing nodes, we stop evaluating children as soon as we get a child whose value is greater than the current upper bound (**beta**).

$$\mathbf{Max} = \alpha = -\infty$$

$$\mathbf{Min} = \beta = +\infty$$

 $\alpha \ge \beta$

Calculate the following:

- Complete Path
- Time Complexity
- Space Complexity
